PRODUCT REQUIREMENTS DOCUMENT

Event Management & Customer Relationship Platform

Version: 1.0
Project period: November–December 2026
Initial pilot: Spa Operations + December 18 Holiday Experience

---

1. Product Vision

Build a centralized platform that helps businesses and independent event organizers acquire customers, manage experiences, maintain customer relationships, and generate repeat business.

The platform combines three primary capabilities:

1. Event management and guest engagement.
2. Customer relationship management (CRM).
3. Business operations and performance intelligence.

The platform should provide the simplicity of an event invitation and RSVP application, combined with the customer management capabilities of a CRM.

The long-term objective is to make customer acquisition, event execution, and customer retention part of one connected operating system.

2. Target Users

User Group A: Businesses

Examples:

- Spas and wellness studios.
- Retail businesses.
- Beauty and personal care businesses.
- Hospitality businesses.
- Service providers.

Primary needs:

- Maintain customer records.
- Manage appointments and services.
- Host events.
- Communicate with customers.
- Track customer engagement.
- Increase repeat purchases and bookings.

User Group B: Independent Event Organizers

Examples:

- Event planners.
- Networking organizations.
- Community event hosts.
- Creative experience producers.
- Pop-up market organizers.

Primary needs:

- Create and publish events.
- Manage multiple events.
- Coordinate vendors.
- Collect registrations and payments.
- Communicate with guests.
- Track attendance.
- Maintain relationships with previous attendees.

3. Platform Architecture

The platform must support multiple independent business accounts.

Each account operates within its own secure environment.

Core modules

Module 1: Event Management

- Event creation.
- Event landing pages.
- Shareable invitation links.
- RSVP management.
- Ticketing and registration.
- Guest lists.
- Capacity management.
- Check-in.

- Event reminders.
- Guest announcements.

Module 2: CRM

- Customer profiles.
- Contact information.
- Interaction history.
- Purchase and attendance history.
- Customer segmentation.
- Communication preferences.
- Follow-up management.
- Retention tracking.

Module 3: Communications

- Email notifications.
- SMS notifications.
- Event reminders.
- Confirmation messages.
- Follow-up campaigns.
- Audience-specific announcements.
- Communication templates.
- Consent and unsubscribe management.

Module 4: Business Operations

- Appointment and booking management.
- Service and product records.
- Vendor management.
- Task management.
- Revenue and expense tracking.
- Business reporting.

Module 5: Analytics

- Registration conversion.
- Attendance rates.
- Customer acquisition.
- Repeat attendance.
- Customer retention.
- Revenue per event.
- Event profitability.
- Campaign performance.

---

4. Hybrid Customer Database Requirements

This is one of the most important technical requirements.

The platform must support two distinct customer relationship environments.

A. Private Business CRM

Each business has its own customer database.

Businesses must be able to:

- Create customer profiles.
- Import existing contacts.
- Record customer interactions.
- Track purchases and appointments.
- Segment customers.
- Send authorized communications.
- Export their customer records.
- Manage access permissions.

A customer belonging to one business must not automatically become accessible to another business.

B. Shared Customer Network

The platform may maintain a shared customer identity layer.

However, participation must be voluntary.

Customers may:

- Create a platform profile.
- Manage their communication preferences.
- Choose which businesses they want to hear from.
- Opt into participating business networks.
- Revoke permissions.
- Review or request deletion of applicable personal information.

A business may only access customer information that the customer has explicitly authorized it to access.

C. Cross-Business Relationships

Example:

A customer attends a holiday experience hosted by a spa, with Jade Flowers and a charcuterie vendor participating.

The system should support:

- The event organizer maintaining its authorized guest records.
- The spa receiving customer information from guests who expressly opt into spa communications.
- Jade Flowers receiving customer information from guests who expressly opt into Jade Flowers communications.
- The charcuterie vendor receiving information only where the guest has separately authorized it.

One RSVP must not automatically authorize marketing from every participating business.

---

5. User Roles and Permissions

The platform should support:

Role	Permissions
Platform administrator	Manage platform infrastructure and accounts
Business owner	Manage business account and records
Business manager	Manage authorized operations
Event organizer	Create and manage events
Event staff	Access assigned event tasks

Vendor	Access assigned vendor information
Customer/guest	Manage their profile, registrations and preferences

Permissions should be configurable and enforced at the account and record level.

---

6. Functional Requirements

Event Management

The system must allow an organizer to:

1. Create an event.
2. Add event descriptions, dates, locations and images.
3. Publish a shareable event page.
4. Configure free or paid registration.
5. Set capacity limits.
6. Collect guest registration information.
7. View and manage RSVPs.
8. Send event confirmations.
9. Send reminders.
10. Check guests in.
11. Review attendance and event performance.

CRM

The system must allow businesses to:

1. Create and maintain customer profiles.
2. Store customer contact information.
3. Record customer interactions.
4. Track event attendance.
5. Record relevant transactions.
6. Organize customers into segments.
7. Track communication consent.
8. Schedule follow-ups.
9. Identify inactive customers.

10. Review customer engagement history.

Communications

The system must support:

- Email integration.
- SMS integration.
- Automated event confirmations.
- Scheduled reminders.
- Follow-up workflows.
- Customer segmentation.
- Opt-out processing.
- Delivery and engagement reporting.

Email and SMS marketing must respect applicable consent requirements, including TCPA, CAN-SPAM and applicable privacy laws.

Business Operations

The system should allow businesses to manage their existing operational workflows without requiring them to adopt an entirely new business model.

For the initial spa pilot, prioritize:

- Appointment workflows.
- Customer intake.
- Service records.
- Customer follow-up.
- Staff coordination.
- Checkout workflows.

Integration with existing booking and payment systems should be evaluated before attempting to replace them.

---

7. December 18 Proof of Concept

The Holiday Spa Experience will serve as the initial live event implementation.

Required workflow

Before the event

- Create the event.
- Publish its landing page.
- Generate a registration link.
- Configure guest information collection.
- Configure communication preferences.
- Manage vendors.
- Track expenses.
- Monitor registration.

During the event

- Access guest lists.
- Check in attendees.
- Track attendance.
- Record event transactions where supported.
- Manage operational tasks.

After the event

- Review attendance.
- Review event expenses and revenue.
- Analyze customer opt-ins.
- Record authorized customer interactions.
- Generate a performance report.
- Identify follow-up opportunities.

Proof-of-concept measurements

Metric	What it demonstrates
Registrations	Customer acquisition
Attendance	Event engagement
Check-in completion	Operational usability
Marketing opt-ins	Permission-based relationship building

Follow-up delivery	Communication functionality
Repeat bookings or purchases	Retention opportunity
Event profitability	Business value

---

8. MVP Development Priorities

Phase 1: November 2026 — Foundation

Priority:

- Account creation.
- Business environments.
- User permissions.
- Event creation.
- Landing pages.
- RSVP collection.
- Guest database.
- Basic CRM profiles.

Phase 2: December 1–11 — Operational MVP

Priority:

- Event registration management.
- Guest check-in.
- Email confirmations.
- Event reminders.
- Vendor coordination.
- Customer consent management.
- Basic reporting.

Phase 3: December 18 — Live Implementation

Use the platform to operate the holiday event.

Do not introduce untested features during the live event.

Phase 4: December 21–23 — Evaluation

- Analyze event results.
- Document system performance.
- Identify operational gaps.
- Collect authorized user feedback.
- Prepare the commercial proof-of-concept report.

Future development

- Advanced CRM automation.
- Recurring events.
- Membership management.
- Loyalty programs.
- Advanced audience segmentation.
- Multi-event analytics.
- Vendor marketplaces.
- Third-party integrations.
- Advanced customer retention intelligence.

---

9. Technical and Security Requirements

The development team must account for:

- Multi-tenant architecture.
- Strict business-level data isolation.
- Role-based access control.
- Secure authentication.
- Encryption in transit and at rest.
- Customer consent records.
- Audit logs.
- Data export and deletion workflows.
- Backup and recovery.
- Secure payment processing through an appropriate payment provider.
- Scalable API architecture.
- Mobile-responsive interfaces.

The platform must not expose one business’s customer records to another business through search, reporting, exports or shared network functionality.

---

10. Product Success Criteria

The initial pilot will be considered successful when:

1. The spa's existing operations have been documented.
2. Software capabilities have been mapped to actual operational needs.
3. An organizer can create and publish an event independently.
4. Guests can register without complicated onboarding.
5. The organizer can manage registrations and attendance.
6. Customer information is stored with appropriate permissions.
7. Businesses can maintain separate CRM environments.
8. Authorized communications can be delivered.
9. Event performance can be measured.
10. The team can demonstrate a credible path toward repeat customer engagement.

---

11. Product Development Principle

The platform must be designed around the following principle:

An event is not an isolated transaction. It is an opportunity to establish and maintain a customer relationship.

The platform should make it easy for businesses and organizers to create experiences, manage the people who participate, and build lasting relationships through relevant and permission-based engagement.

The initial spa and holiday event pilots should validate the underlying architecture before the team expands into additional industries.

End goal: A scalable, multi-business platform that connects event management, customer relationships and business operations without compromising customer ownership, privacy or usability.
